

AUTOMATIC MACHINE FOR REMOVING THE CALYX FROM STRAWBERRIES

MCF-500 series

AUTOMATIC STRAWBERRY CAPPING LINE COMPOSED OF 6 MCF-500 MACHINES

Efficient and versatile production line for processing up to 2400_{Kg/hour}

The MCF series automatic line stands for a new dimension in the strawberries production. It stands out thanks to its innovative design, high degree of automation, simple operation, and effectiveness in the strawberry decapping. It offers low production costs with maximum yield.

Robustly constructed from stainless steel and technical plastics, the MCF series is designed for easy cleaning and hygienic processing of the product.

Each machine owns two loading points assisted by feed hoppers. This machine makes the strawberry calyx cutting in a continuous way, achieving an effective separation of the strawberry and the waste product. Processed product is later poured onto a conveyor belt.

This MCF series automatic line is able to process a wide range of shapes and sizes of strawberries just being necessary a previous calibration.

Each machine of the MCF series can operate in an autonomous or integrated way on the line.

Key features and benefits:

- Average production of 2400 Kg/hour (Output product).
- Reduces the necessary workforce for calyx removal of strawberry by 90%.
- Cutting process is made in a hygienic way with a high quality and repeatability of the finished product.
- The line is designed for easy cleaning.
- Made with high quality materials.
- Remote monitoring to support the correct operation and maintenance of the machines.
- Modular and scalable line for every capacity need.
- Comply with CE regulations.
